

Eratosthenes - chasing shadows to investigate glacier change worldwide

Bas Altena, Bert Wouters, Michiel van den Broeke, A. Kääb, B. Raup, T. Scambos, T. Harrison & S. Saunier
Utrecht University, eScience center, University of Oslo, National Snow and Ice datacenter, University of Colorado, Planet & Telespazio

Eratosthenes in a nutshell

a project that,

processes the **historical** satellite archive ...

with **ancient** techniques ...

but with **modern day** processing power

aim: **surface elevations from shadows**

Research of the Cryosphere (“cryo” is Greek for “cold”)

Observed regional impacts from changes in the ocean and the cryosphere

from the newest IPCC special report on Oceans and Cryosphere, chapter 2.

Aristotle (384 - 322 BC) : proof of Earth’s round shape

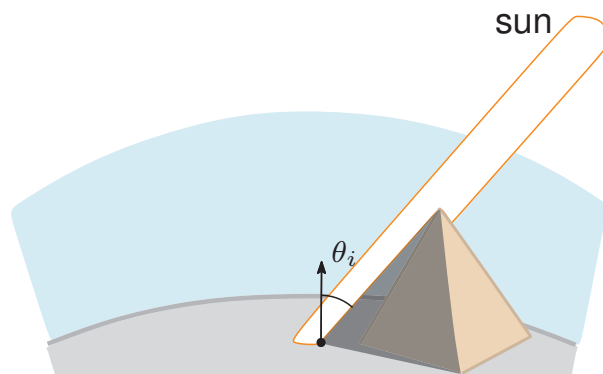

crescent shape of cast shadow on the Moon, observable during a lunar eclipse

Eratosthenes (276 -195 BC) : estimates Earth's circumference

Thales (623 - 548 BC) : founder of the technique

Thales (623 - 548 BC) : from the ground, to estimate its top

Sentinel-2 (2015 - ... AC) : from above, estimating the surface

Eratosthenes in a nutshell

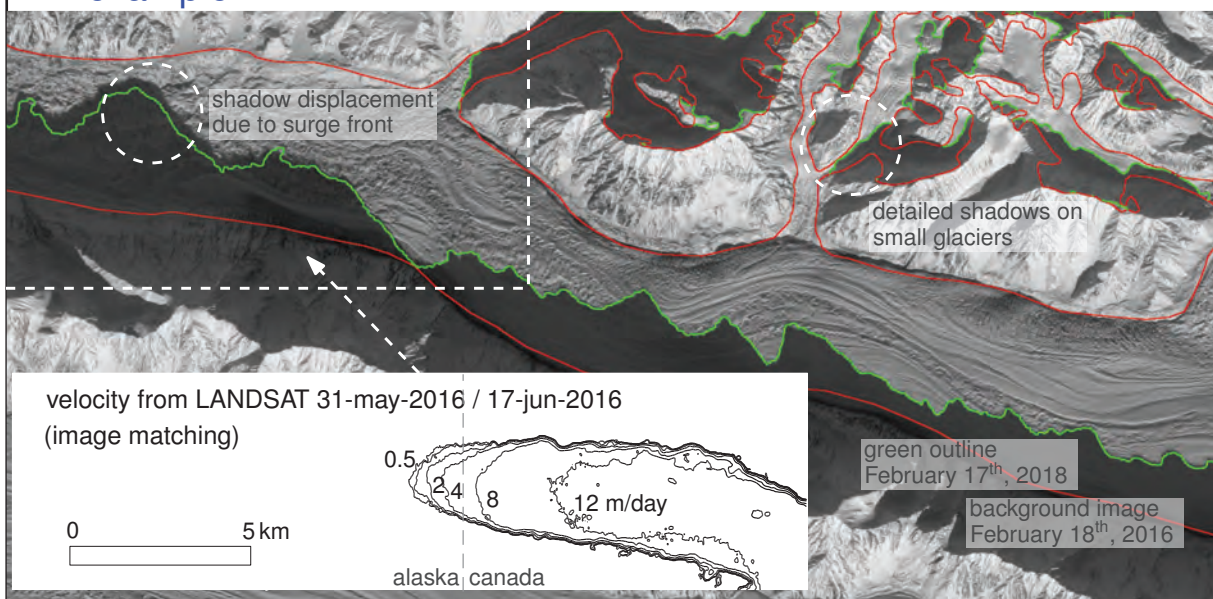

use satellite imagery over time,
extract elevation changes.

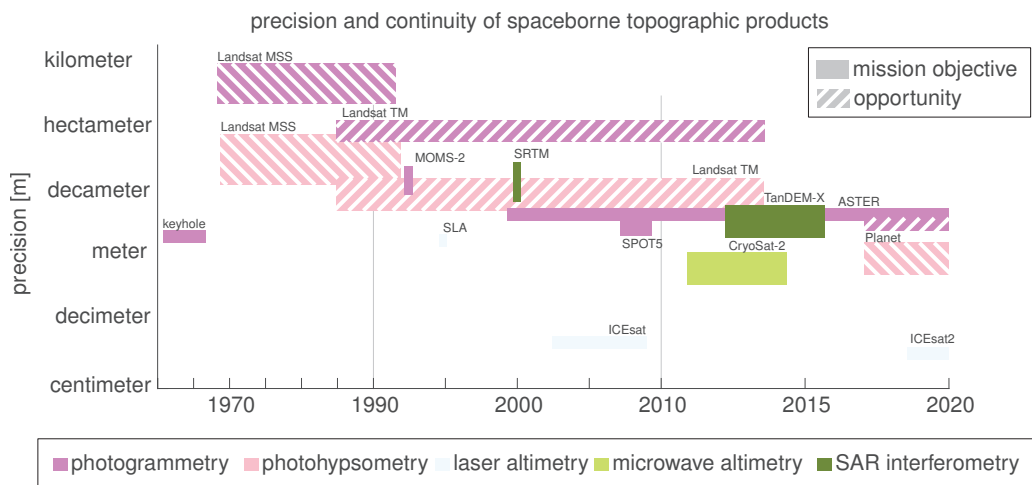

provide measurements to glacier modellers

get better understanding of freshwater availability,
local climate & sea level rise.

An example

Potential in the EO archive

methodology

Numbers

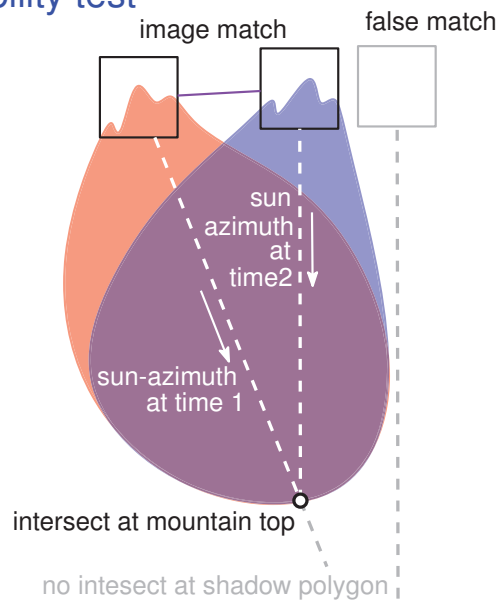

total areal extent of glaciers is 726 000 km² (NL: 34 000 km²)
covering 1797 Sentinel-2 tiles & 1927 Landsat scenes

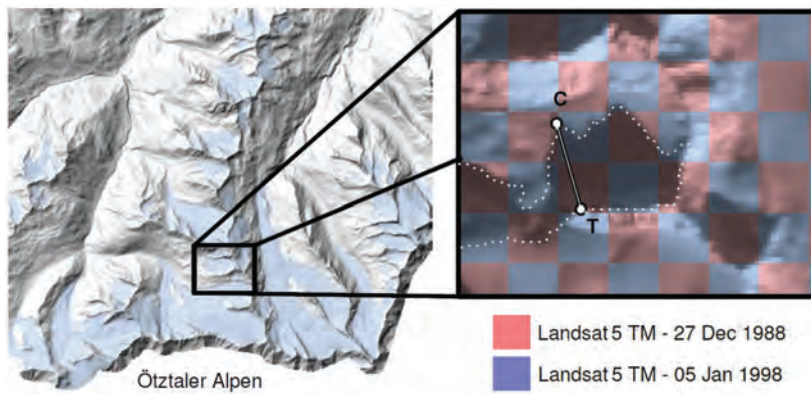

Mission	Period	Agency
Landsat legacy	1972 -	USGS, ESA
SPOT	1986 - 2014	CNES
CBERS/IRS legacy	1999 -	INPE
RapidEye	2008 -	Planet
Sentinel-2	2016 -	ESA
SkySat	2013 - ...	Planet
Planet Dove	2016 -	Planet

Methodology: reliability test

Methodology: overview and example

Configurations to extract topography
